     The present invention provides a method of detg. a set of primer pairs for
AΒ
```

amplifying a group of related nucleotide sequences. A method of the invention is performed by identifying a group of related nucleotide sequences; generating the set of primers that matches each of the related nucleotide sequences; detg. for each systematic pairing of each primer which of the related nucleotide sequences are amplified; and selecting from the systematic pairings a subset which amplifies all of the related nucleotide sequences. The invention also provides a method of using a set of primer pairs, which amplify a group of related nucleotide sequences, to identify nucleotide sequences related to the original group of nucleotide sequences. Eight-mer primer pairs are provided for amplification of genes encoding nuclear receptors, G-protein coupled receptors, apoptosis-assocd. proteins, DNA repair enzymes, and replication enzymes. The invention also provides a computer app. for carrying out the computer-executed steps of the method. The invention further provides a computer program product comprising a signal bearing media for carrying out the method.

The present sequence is that of the Mycobacterium tuberculosis rpoB (rifampin resistance) gene amplification primer rpoB-F (bp 2201-2220). It is used with the reverse primer given in AAA49824 and with the sequencing primers given in AAA49825 and AAA49826 for the detection and analysis of antibiotic resistance-associated mutations of the rpoB gene (see AAA49863). Amplification and cycle sequencing primers (see AAA49823-62) have been developed for the detection and analysis of antibiotic resistance-associated mutations in defined regions of rpoB (rifampin), katG (isoniazid), oxyR-aphC PR

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Mycobacterium
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The antibiotic resistance spectrum (ARS) of a mycobacterium can be determined by amplifying the relevant part of the antibiotic resistance gene, i.e. the M. tuberculosis rook gene fragment amplified using the primer set AAT12091-98, hybridising it with a least 1 rpoB gene probe, detecting the hybridising it with a inferring the ARS, and opt. the spp., from the differential hybridisation patterns. The method is partic. useful for the detection of rifamplicin and/or rifabutin resistance in M. leprae or M. tuberculosis, and mycobacterial spp. identification. The method is rapid and reliable and provides simultaneous determn.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               25-SEP-2000

밁 Q

rpoB (rifampin resistance) gene sequencing primer rpoB-5s (bp 200-2220). It is used with the reverse primer given in AAA49826 and with the amplification primers given in AAA49824 for the detection and analysis of antibiotic resistance-associated mutations of the rpoB gene (see AAA4983). Amplification and cycle sequencing primers (see AAA49823-62) have been developed for the detection and analysis of antibiotic resistance-associated mutations in defined regions of rpoB (rifampin), katG (isoniazid), oxyR-aphC PR (isoniazid), mabA (isoniazid), rpsL/sl2 (streptomycin), kB/rrs (streptomycin), embB (ethambutol), pncA (pyrazinamide), gyrA (ciprofloxacin) and 23S (azithromycin) genes of M. tuberculosis.

Claim 4; Page

5; 43pp; English.

present sequence is that of the Mycobacterium tuberculosis

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ρy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               (isoniazid), mabA (isoniazid), rpsL/s12 (streptomycin), 16S/rrs (streptomycin), mabB (ethambutol), pncA (pyrazinamide), gyrA (ciprofloxacin) and 23S (azithromycin) genes of M. tuberculosis. These primers can be used in a method for the detection and characterization of M. tuberculosis present in a sputum sample. The method involves performing a sequencing procedure, with or Without prior amplification, to detect the presence of M. tuberculosis, and if present to evaluate the rpoB, katG, rpsL/s12 and 23S genes for the presence of antibiotic-inducing mutations. The presence of antibiotic resistance-inducing mutations. Genotypic tests are rapid, sensitive and accurate providing information as to

                      This sequence represents a mycobacterial rpoB gene fragment, that is amplified using the PCR primers of the invention. The primers form a method of detecting and identifying mycobacterial species by constructing a phylogenetic tree for the species. The use of the primers for sequence-specific amplification of the rpoB gene (encoding the beta subunit of RNA polymerase) from mycobacterial species provides an efficient way of characterising these species. In addition to phylogenetic analysis, the rpoB gene can be used as an alternative to the 16s rRNA gene because it has four subunits, which are highly conserved throughout prokaryotes. The method is particularly useful for slow growing, fastidious or uncultivatable mycobacteria. Also, rifampin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     These primers can be used in a method for the detection and characterization of M. tuberculosis present in a sputum sample. The method involves performing a sequencing procedure, with or without prior amplification, to detect the presence of M. tuberculosis, and if present to evaluate the rpoB, katG, rpsL/s12 and 23S genes for the presence of antibiotic-inducing mutations. If M. tuberculosis is detected, a second sequencing procedure is performed on the sample to evaluate additional genes for the presence of antibiotic resistance-inducing mutations. Genotypic tests are rapid, sensitive and accurate providing information as t
                                                                                                                                                                                                                                                                                                                                                                                                                                                              New pair of polymerase chain reaction (PCR) primers - for sequence-specific amplification of the rpoB gene from mycobacterial species, useful for detecting and identifying mycobacterial species
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      RpoB gene; mycobacteria; phylogenetic tree construction; mycobacterial species identification; phylogenetic analysis; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match
                                                                                                                                                  sequence-specific amplification of the rpoB gene (encoding the beta subunit of RNA polymerase) from mycobacterial species provides an efficient way of characterising these species. In addition to phylogenetic analysis, the rpoB gene can be used as an alternative to the 16s rRNA gene because it has four subunits, which are highly conserved throughout prokaryotes. The method is particularly useful for slow growing, fastidious or uncultivatable mycobacteria. Also, rifampin
                                                                                                                                      susceptibility can be
                                                                                                                                                                                                                                        This sequence represents a mycobacterial rpoB gene fragment, that is amplified using the PCR primers of the invention. The primers form a method of detecting and identifying mycobacterial species by constructing a phylogenetic tree for the species. The use of the primers for

                                                                                                                                                                                                                                                                                                                                                                  This sequence represents a mycobacterial rpoB gene fragment, that is amplified using the PCR primers of the invention. The primers form a method of detecting and identifying mycobacterial species by constructing a phylogenetic tree for the species. The use of the primers for sequence-specific amplification of the rpoB gene (encoding the beta subunit of RNA polymerase) from mycobacterial species provides an efficient way of characterising these species. In addition to phylogenetic analysis, the rpoB gene can be used as an alternative to the 16S rRNA gene because it has four subunits, which are highly conserved throughout prokaryotes. The method is particularly useful for slow growing, fastidious or uncultivatable mycobacteria. Also, rifampin susceptibility can be simultaneously determined in M. tuberculosis.

The primers form a method of detecting and identifying mycobacterial species by constructin a phylogenetic tree for the species. The use of the primers for sequence-specific amplification of the rpoB gene (encoding the beta subunit of RNA polymerase) from mycobacterial species provides an efficient way of characterising these species. In addition to phylogenetic analysis, the rpoB gene can be used as an alternative to the 16s rRNA gene because it has four subunits, which are highly conserved throughout prokaryotes. The method is particularly useful for slow growing, fastidious or uncultivatable mycobacteria. Also, rifampin

The identification probe is comprised of species-specific DNA sequences of mycobacterial rpoB gene and the detection probe is comprised of one or more modified codons of mycobacterial rpoB gene. The method involves amplifying rpoB gene fragments of specimen by Polymerase Chain Reaction (PCR) and discriminating species by fluorescent intensity corresponding to a particular species. The specimen by polymerase that proceeding to a particular species in the specimen species and primers of the represent mycobacterium species identification probes and primers of the
                              Kit for mycobacterial species identification and drug resistance detection, has oligonucleotide chip with species identification probacterial drug-resistance detection probe, and its contras

The identification probe is comprised of species-specific DNA sequences of mycobacterial rpoB gene and the detection probe is comprised of one or more modified codons of mycobacterial rpoB gene. The method involves amplifying rpoB gene fragments of specimen by Polymerase Chain Reaction (PCR) and discriminating species by fluorescent intensity corresponding to a particular species. The specimen is preferably uncultured sputum, blood or cerebrospinal fluid of a patient. Sequences AAS99478-AAS99569 represent mycobacterium species identification probes and primers of the

             The invention relates to a diagnostic kit for mycobacterial species identification and drug resistance detection comprising an oligonucleotide chip including a species identification probe, a mycobacterial drug-resistance detection probe a contrast group probe corresponding to each drug resistance detection probe, and a marker for detecting a hybridisation of the oligonucleotide chip and a specimen. The identification probe is comprised of species-specific DNA sequences of mycobacterial rpoB gene and the detection probe is comprised of one or more modified codons of mycobacterial rpoB gene. The method involves amplifying rpoB gene fragments of specimen by Polymerase Chain Reaction (PCR) and discriminating species by fluorescent intensity corresponding blood or cereborospinal fluid of a patient.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  mycobacterial rpoB gene and the detection probe is comprised of one or more modified codons of mycobacterial rpoB gene. The method involves amplifying rpoB gene fragments of specimen by Polymerase Chain Reaction (PCR) and discriminating species by fluorescent intensity corresponding to a particular species. The specimen is preferably uncultured sputum, blood or cerebrospinal fluid of a patient. Sequences AAS99478-AAS99569 represent mycobacterium species identification probes and primers of the

                   PCR amplification was used to obtain rpoB genes from rifamplcin-resistant Mycobacterium leprae strains. A comparison with the sequence of the rpoB gene from sensitive strains (AAQ51532) reveamutations in the region encoding amino acids 400-450. The correspondant was isolated from M.tuberculosis (AAQ61457). A common mutation seen in resistant strains occurs at codon 425 where Ser
                 substituted, m

(streptomycin), embB (ethambutol), pncA (pyrazinamide), gyrA
(ciprofloxacin) and 23s (azithromycin) genes of M. tuberculosis.
Characterization of M. tuberculosis present in a sputum sample.
The method involves performing a sequencing procedure, with or
without prior amplification, to detect the presence of M.
tuberculosis, and if present to evaluate the rpoB, katG, rpsL/s12
Cand 23s genes for the presence of antibiotic-inducing mutations.
Claid 23s genes for the presence of antibiotic-inducing moutations.
Claid 23s genes for the presence of antibiotic-inducing moutations.
Claid 23s genes for the presence of antibiotic-inducing moutations.
Claid 23s genes for the presence of antibiotic-inducing procedure is performed on the sample to evaluate additional genes for the presence of antibiotic resistance-inducing mutations. Genotypic tests are rapid, sensitive and accurate providing information as to
                                                                                                                                                                                                                                      The present sequence is that of the Mycobacterium tuberculosis rpoB (rifampin resistance) gene (bp2161-2640). Amplification and cycle sequencing primers (see AAA49823-62) are used for the detect and analysis of antibiotic resistance-associated mutations in defined regions of rpoB (rifampin), katG (isoniazid), oxyR-aphC PF (isoniazid), mabA (isoniazid), rpsL/s12 (streptomycin), 16S/rrs

                                                                                                                         Mycobacterium tuberculosis potential drug target gene
                                                                                                                                                                                                                                                                                                                                                                                      tuberculosis, and may be used to amplify a sample DNA by targeting a portion of the gene encoding rpoB. The 1st several bases comprise nonhybridizing tail consisting of filler bases followed by a restriction site incorporated to facilitate cloning using the amplicon at a later date, if desired. The remaining bases hybridize to bacterial rpoB DNA. The method provides for the detection of M. susceptibility, particularly to rifamycin. The method can provide often greater than 95% sensitivity and 100% specificity. The biological sample is a fluid or tissue sample from a human.

                                                                                                                                                                                                                                   method involves providing an unknown nucleotide or polypeptide sequences, and comparing it to a number of sequences along with at least one algorithm capable of analysing a functional relationship between nucleotide and polypeptide sequences. The method is useful for characterising the function of nucleic acids and polypeptides that may be useful as a target for a drug or essential for the growth or viability of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            12-NOV-1999;

                                                                                                                                                                                                                                                                                                                         This invention relates to a method for identifying a nucleotide or polypeptide sequence that may be a drug target, or essential for growth or viability of an organism. Polypucleotide sequences AAH51947 - AAH52092 represent DNA encoding proteins AAG81096 - AAG81241, Mycobacterium tuberculosis proteins which are potential drug targets. The DNA and protein sequences are used to illustrate the method of the invention. The

     rpoB (rifampin resistance) gene amplification primer rpoB-F (bp 2201-2220). It is used with the reverse primer given in AAA49824 and with the sequencing primers given in AAA49825 and AAA49826 for the detection and analysis of antibiotic resistance-associated mutations of the rpoB gene (see AAA4983). Amplification and cycle sequencing primers (see AAA49823-62) have been developed for the detection and analysis of antibiotic resistance-associated mutations in defined
  regions of rpoB (rifampin),
                                                                                                      The present sequence is that of the Mycobacterium tuberculosis
                                                                                                                                     Claim 4; Page 4; 43pp; English.
                                                                                                                                                          Method for the detection and characterization of Myctuberculosis with antibiotic resistance in a sample
                                                                                                                                                                                                                                                                                         11-DEC-1998;
                                                                                                                                                                                                                                                                                                                   10-DEC-1999;
                                                                                                                                                                                                                                                                                                                                                                                                  Mycobacterium tuberculosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The antibiotic resistance spectrum (ARS) of a mycobacterium can be determined by amplifying the relevant part of the antibiotic resistance gene, i.e. the M. tuberculosis rpoB gene fragment amplified using the primer set ART12091-98, hybridising it with a least 1 rpoB gene probe, detecting the hybrids formed and inferring the ARS, and opt. the spp., from the differential hybridisation patterns. The method is partic. useful for the detection of rifampicin and/or rifabutin resistance in M. leprae or M. tuberculosis, and mycobacterial spp. identification. The method is rapid and reliable and provides simultaneous determn.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Qy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   (isoniazid), mabA (isoniazid), rpsL/s12 (streptomycin), 16S/rrs (streptomycin), embB (ethambutol), pncA (pyrazinamide), gyrA (ciprofloxacin) and 23S (azithromycin) genes of M. tuberculosis. These primers can be used in a method for the detection and characterization of M. tuberculosis present in a sputum sample. The method involves performing a sequencing procedure, with or without prior amplification, to detect the presence of M. tuberculosis, and if present to evaluate the rpoB, katc, rpsL/s12 and 23S genes for the presence of antibiotic-inducing mutations. If M. tuberculosis is detected, a second sequencing procedure is performed on the sample to evaluate additional genes for the presence of antibiotic resistance-inducing mutations. Genotypic tests are rapid, sensitive and accurate providing information as to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Matches

The present sequence is that of the Mycobacterium tuberculosis rpoB (rifampin resistance) gene sequencing primer rpoB-5s (bp 2201-2220). It is used with the reverse primer given in AAA49826 and with the amplification primers given in AAA49823 and AAA49824 for the detection and analysis of antibiotic resistance-associated mutations of the rpoB gene (see AAA49863). Amplification and cycle sequencing primers (see AAA49823-62) have been developed for the detection and analysis of antibiotic resistance-associated mutations in defined regions of rpoB (rifampin), katG (isoniazid), oxyR-aphC PR (isoniazid), mabA (isoniazid), rpoA (pyrazinamide), gyrA (ciprofloxacin) and 23S (azithromycin) genes of M. tuberculosis.

                         This sequence represents a mycobacterial rpoB gene fragment, that is amplified using the PCR primers of the invention. The primers form a method of detecting and identifying mycobacterial species by constructing a phylogenetic tree for the species. The use of the primers for sequence-specific amplification of the rpoB gene (encoding the beta subunit of RNA polymerase) from mycobacterial species provides an efficient way of characterising these species. In addition to phylogenetic analysis, the rpoB gene can be used as an alternative to the 16s rRNA gene because it has four subunits, which are highly conserved throughout prokaryotes. The method is particularly useful for slow growing, fastidious or uncultivatable mycobacteria. Also, rifampin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              These primers can be used in a method for the detection and characterization of M. tuberculosis present in a sputum sample. The method involves performing a sequencing procedure, with or without prior amplification, to detect the presence of M. tuberculosis, and if present to evaluate the rpoB, katG, rpsL/sl2 and 23S genes for the presence of antibiotic-inducing mutations. If M. tuberculosis is detected, a second sequencing procedure is performed on the sample to evaluate additional genes for the presence of antibiotic resistance-inducing mutations. Genotypic tests are rapid, sensitive and accurate providing information as the sample to evaluate additional sensitive and accurate providing information as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    кров gene; mycobacteria; mycobacterial species ide

                                                                          Query Match
                                                                                                                                                  sequence specific amplification of the rpoB gene (encoding the beta subunit of RNA polymerase) from mycobacterial species provides an efficient way of characterising these species. In addition to phylogenetic analysis, the rpoB gene can be used as an alternative to the 16S TRNA gene because it has four subunits, which are highly conserved throughout prokaryotes. The method is particularly useful for slow growing, fastidious or uncultivatable mycobacteria. Also, rifampin
                                                                                                                                                                                                                                                                                                                                                                                   WPI;

                                                                                                                                                                                                                                                                                                                                              This sequence represents a mycobacterial rpoB gene fragment, that is amplified using the PCR primers of the invention. The primers form a method of detecting and identifying mycobacterial species by constructing a phylogenetic tree for the species. The use of the primers for sequence-specific amplification of the rpoB gene (encoding the beta subunit of RNA polymerase) from mycobacterial species provides an efficient way of characterising these species. In addition to phylogenetic analysis, the rpoB gene can be used as an alternative to the 16s rRNA gene because it has four subunits, which are highly conserved throughout prokaryotes. The method is particularly useful for slow growing, fastidious or uncultivatable mycobacteria. Also, rifampin susceptibility can be simultaneously determined in M. tuberculosis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This sequence represents a mycobacterial rpoB gene fragment, that is amplified using the PCR primers of the invention. The primers form a method of detecting and identifying mycobacterial species by constructing a phylogenetic tree for the species. The use of the primers for sequence-specific amplification of the rpoB gene (encoding the beta subunit of RNA polymerase) from mycobacterial species provides an efficient way of characterising these species. In addition to phylogenetic analysis, the rpoB gene can be used as an alternative to the 16s rRNA gene because it has four subunits, which are highly conserved throughout prokaryotes. The method is particularly useful for slow growing, fastidious or uncultivatable mycobacteria. Also, rifampin susceptibility can be simultaneously determined in M. tuberculosis.
                                                                                                                                                                                                                                                                                                                                                                                                                             Drug resistance oligonucleotide

The identification probe is comprised of species-specific DNA sequences of mycobacterial robs gene and the detection probe is comprised of one or more modified codons of mycobacterial rpoB gene. The method involves amplifying rpoB gene fragments of specimen by Polymerase Chain Reaction (PCR) and discriminating species by fluorescent intensity corresponding to a particular species. The specimen is preferably uncultured sputum, blood or cerebrospinal fluid of a patient. Sequences AAS99478-AAS99569 represent mycobacterium species identification probes and primers of the
                                                              Kit for mycobacterial species identification and drug resistance detection, has oligonucleotide chip with species identification a mycobacterial drug-resistance detection probe, and its contrast

The invention relates to a diagnostic kit for mycobacterial species identification and drug resistance detection comprising an oligonucleotide chip including a species identification probe, a mycobacterial drug-resistance detection probe, a contrast group prob corresponding to each drug resistance detection probe, and a marker detecting a hybridisation of the oligonucleotide chip and a specimen identification probe is comprised of species-specific DNA sequences

and a specimen.

The identification probe is comprised of species-specific DNA sequences of mycobacterial rpoB gene and the detection probe is comprised of one or more modified codons of mycobacterial rpoB gene. The method involves amplifying rpoB gene fragments of specimen by Polymerase Chain Reaction (PCR) and discriminating species by fluorescent intensity corresponding to a particular species. The specimen is preferably uncultured sputum, blood or cerebrospinal fluid of a patient. Sequences AAS99478-AAS99569

                                                                                                                                                    The invention relates to a diagnostic kit for mycobacterial species identification and drug resistance detection comprising an oligonucleotide chip including a species identification probe, a mycobacterial drug-resistance detection probe, a contrast group probe corresponding to each drug resistance detection probe, and a marker fo detecting a hybridisation of the oligonucleotide chip and a specimen. Identification probe is comprised of species-specific DNA sequences of the original probability of the oligonucleotide chip and a specimen.
            mycobacterial rpoB gene and the detection probe is comprised of one or more modified codons of mycobacterial rpoB gene and the detection probe is comprised of one or more modified codons of mycobacterial rpoB gene. The method involves amplifying rpoB gene fragments of specimen by Polymerase Chain Reaction (PCR) and discriminating species by fluorescent intensity corresponding to a particular species. The specimen is preferably uncultured sputum, blood or cerebrospinal fluid of a patient. Sequences AAS99478-AAS99569 represent mycobacterium appears in the specimen is sequences.
                                                                                                                                                                                                                                                                                                                                                                      Disclosure; Page 21; 74pp;

The method involves amplifying rpoB gene fragments of specimen by Polymerase Chain Reaction (PCR) and discriminating species by fluorescent intensity corresponding to a particular species. The specimen is preferably uncultured sputum, blood or cerebrospinal fluid of a patient. Sequences AAS99478-AAS99569 represent mycobacterium species identification probes and primers of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    (BIOM-)

                     PCR amplification was used to obtain rpoB genes from rifamplcin-resistant Mycobacterium leprae strains. A comparison with the sequence of the rpoB gene from sensitive strains (AAQ51532) revermutations in the region encoding amino acids 400-450. The correspression was isolated from M.tuberculosis (AAQ61457). A common mutation seen in resistant strains occurs at codon 425 where Ser

                                                                                                                                The present sequence is that of the Mycobacterium tuberculosis CC rpoB (rifampin resistance) gene (bp2161-2640). Amplification and CC cycle sequencing primers (see AAA49823-62) are used for the detection CC and analysis of antibiotic resistance-associated mutations in CC (isoniazid), mabA (isoniazid), resistance-associated mutations in CC (isoniazid), mabA (isoniazid), rpsL/s12 (streptomycin), 165/rrs CC (streptomycin), embB (ethamburol), pncA (pyrazinamide), gyrA CC (ciprofloxacin) and 23S (azithromycin) genes of M. tuberculosis. CC These primers can be used in a method for the detection and CC characterization of M. tuberculosis present in a sputum sample. CC The method involves performing a sequencing procedure, with or CC without prior amplification, to detect the presence of M. tuberculosis, and if present to evaluate the prob, katG, rpsL/s12 CC and 23S genes for the presence of antibiotic-inducing mutations. CC performed on the sample to evaluate additional genes for the presence of antibiotic resistance-inducing mutations. Genotypic CC tests are rapid, sensitive and accurate providing information as to CC cantibiotic treatment options.

The 1st several bases comprise nonhybridizing tail consisting of filler bases followed by a restriction site incorporated to facilitate cloning using the amplicon at a later date, if desired. The remaining bases hybridize to bacterial rpoB DNA. The method provides for the detection of M. tuberculosis and the concurrent determination of its drug susceptibility, particularly to rifamycin. The method can provide often greater than 95% sensitivity and 100% specificity. The biological sample is a fluid or tissue sample from a human.
                                                                                                                                                                      Mycobacterium

                                                                                                                                          This invention relates to a method for identifying a nucleotide or polypeptide sequence that may be a drug target, or essential for growth or viability of an organism. Polypucleotide sequences AAH51947 - AAH52092 represent DNA encoding proteins AAG81096 - AAG81241, Mycobacterium tuberculosis proteins which are potential drug targets. The DNA and protein sequences are used to illustrate the method of the invention. The method involves providing an unknown nucleotide or polypeptide sequences, algorithm capable of analysing a functional relationship between nucleotide and polypeptide sequences. The method is useful for characterising the function of nucleic acids and polypeptides that may be useful as a target for a drug or essential for the growth or viability of an analysis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            12-NOV-1999;

          rpoB (rifampin resistance) gene amplification primer rpoB-F (bp 2201-2220). It is used with the reverse primer given in AAA49824 and with the sequencing primers given in AAA49825 and AAA49826 for the detection and analysis of antibiotic resistance-associated mutations of the rpoB gene (see AAA49863). Amplification and cycle sequencing primers (see AAA49823-62) have been developed for the detection and analysis of antibiotic resistance-associated mutations in defined
                                                                                                             The present sequence is that of the Mycobacterium tuberculosis rpoB (rifampin resistance) gene amplification primer rpoB-F (b)
       regions of rpoB (rifampin),
